Research Focus

Information systems and data governance
- Inter-organizational data sharing, data spaces and ecosystems, governance, and value creation

Digital innovation and platform organizing
- Data intermediaries and products, platform governance, vertical AI, and sectoral/sovereign data infrastructures

Digital regulation and public infrastructures
- Institutional design, public data reuse, and governance of digital technologies

Academic Appointments

ATER (Temporary Teaching and Research Associate) *2025 – Present*
PSL University • Paris, France

Education

PhD in Management *2026*
Paris Dauphine – PSL University • Paris, France

Master 2 in Public Policy *2022*
Paris 1 Panthéon-Sorbonne • Paris, France

Master 1 in Economics *2021*
Toulouse School of Economics • Toulouse, France

Bachelor in Economics *2020*
University of Lorraine • Nancy, France

Bachelor in Public Law *2020*
University of Lorraine • Nancy, France

PhD Dissertation

Governing Data Sharing 2026
Supervisor: Eric Brousseau
Paris Dauphine – PSL University

Abstract

This dissertation investigates how different governance arrangements enable sustainable inter-organizational data sharing. Drawing on information systems research and organization theory, it develops a framework examining three governance structures: data markets, data-sharing ecosystems, and public data infrastructures. Using a multi-method research design, the dissertation combines comparative documentary analysis, quantitative analysis of 4,525 data marketplace listings, 24 interviews with 20 stakeholders across European data-sharing initiatives, and a theory-building literature review of 85 sources. The findings identify three mechanisms: constructing data liquidity to facilitate market exchange, orchestrating collective investments and incentives to sustain ecosystems, and cultivating user capabilities and demand to support public data reuse. The dissertation contributes to data governance theory by demonstrating how sustainable sharing depends on aligning coordination mechanisms with the properties of data, their intended uses, and inter-organizational dependencies.

ICIS 2025 Proceedings (2025)

ABSTRACT

This paper examines which economic and governance conditions make data-sharing ecosystems sustainable beyond pilot projects and public subsidies. Based on a qualitative study of 24 interviews with 20 orchestrators, participants, and experts across European sectors, complemented by practitioner workshops and conference feedback, it identifies six conditions: upfront and recurrent investment, use-case-based innovation, integration complexity, security risk, competitive risk, and incentive alignment. The contribution is to reframe data-sharing ecosystems as generative, use-case-oriented ecosystems rather than data marketplaces, and to show how strategic and technical orchestration must adapt across emergence, diffusion, and diversification phases.

Working Papers

Cultivating Sustained Use in Public Data Infrastructures

Single-authored

ABSTRACT

This paper examines how public data infrastructures can support sustained reuse when users' needs require cooperation from another organization. A theory-building review of 85 sources and 187 coded passages identifies four activities: helping users identify applications, building their skills, negotiating cooperation, and following requests for change through to implementation. It identifies a cultivation gap when no actor has both the responsibility and resources to pursue necessary changes to data or access. The paper extends cultivation theory by connecting user support to authority over data and access conditions.

Channel Composition: A Measurement Theory for Digital Trace Data

with Paul Favier

ABSTRACT

This paper develops a measurement theory explaining how production-channel composition reveals latent behavioral context beyond aggregate digital trace volume. Differences in channel affordances and frictions sort actors across devices, access modes, and interaction modalities. The framework specifies admissible channels, signal-volume and referent-alignment conditions, and a validate-then-deploy approach. An empirical demonstration links Wikipedia pageviews to hotel demand across 704 French destinations from 2018 to 2025, with replication against gate counts at six cultural attractions in Orléans. Channel composition identifies situated visitor activity beyond aggregate pageviews under the stated boundary conditions, advancing digital traces as theoretically grounded measurement instruments.

Making Data Exchangeable: Product Construction and the Redistribution of Coordination

Single-authored

Abstract

This paper explains how data product construction redistributes coordination across artifacts, organizational relationships, and institutions. Temporal renewal, representational transparency, and composability embed recurring work in reusable products, while observation constraints, entitlements, and construction costs leave residual coordination elsewhere. Documentary cases elaborate the mechanism and its boundaries. An analysis of 4,525 marketplace listings from 407 providers finds associations between disclosed product profiles and disclosed exchange support, concentrated in delivery support after adjustment. Component results are uneven: update-frequency disclosures remain associated, composability becomes insignificant after adjustment, and method-independence scores are null. Listings do not measure coordination or completed transactions. Standardization redistributes coordination rather than eliminating it.

Local Adaptation and Data Interoperability in Disaster Response

with Anouck Adrot & Salomé Ritouret

Abstract

This study examines how local adaptations to shared digital forms affect interoperability in disaster response. An embedded case study of an Italy–France disaster-risk-reduction programme draws on 37 interviews, a 2024 simulation, and project documents. It distinguishes structural adaptations, which change categories or forms, from semantic adaptations, which change how existing fields are interpreted. Structural changes can leave traces for inspection, while semantic changes can remain hidden behind unchanged labels. The paper explains this representational opacity and shows why shared revision requires opportunities for discussion, clear responsibility, and time.

Methods

- **Qualitative**: semi-structured interviews, case studies, field observations
- **Quantitative**: panel data models, OLS, logit/probit, causal inference
- **Computational**: NLP, topic modeling, web scraping (Python/R)

Conference Presentations

AIM – Association Information et Management *May 2026 Neuchâtel, Switzerland*

Academic Service

Co-convenor, Working Group "Digital Activities"
Governance & Regulation Chair (with Damien Mayaux)

- Ongoing research seminar series (approx. two seminars per month) on digital regulation, governance, and platform-related public policy

Conference Organizer, Data-Sharing and Digital Regulation Events *2023 – 2025*
Governance & Regulation Chair, University Paris-Dauphine – PSL • Paris, France

- Organized Data Sharing in Europe: DGA and DA (Sep 2023), Conference on Data Governance Act (DGA) Implementation (Sep 2024), and Data-Sharing Ecosystems: Challenges and Turning Points (Sep 2025)

Elected PhD Representative, DRM Council *2023 – Present*
Dauphine Recherches en Management (DRM) • University Paris-Dauphine – PSL

Research Internship Coordinator, M1 IASO (AI and Society) *2026 – Present*
University Paris-Dauphine – PSL

- Supervision of a Master 1 IASO intern on a project automating the categorization of personal-data regulatory texts

Service & Volunteering

Directeur Local Adjoint en Charge de l'Urgence (Deputy Local Director – Emergency Response) *2023 – Present*
French Red Cross • France

- Coordination of emergency response teams during crisis situations
- Logistics, resource allocation, and operational planning
