Dissertation (supervisor: Eric Brousseau): Business models of data-sharing intermediaries and the economics of data-sharing ecosystems.

Research Focus

Data governance & intermediation

- Data-sharing intermediaries, data spaces/ecosystems, governance and value creation

Digital regulation

- Personal data regulation, institutional design, comparative regulatory models (EU/US/China)

Platform & digital economy

- Markets for data, vertical AI, sectoral/sovereign data infrastructures

Methods

- **Qualitative:** semi-structured interviews, case studies, field observations
- **Quantitative:** panel data models, OLS, logit/probit, causal inference
- **Computational:** NLP, topic modeling, web scraping (Python/R)

Skills

- **Programming:** Python, R, $\text{\LaTeX}$
- **Computational:** NLP, topic modeling, BERTopic, zero-shot classification, web scraping
- **Econometrics / statistics:** panel data, OLS, logit/probit, data visualization

Academic Appointments

ATER (Temporary Teaching and Research Associate) University Paris-Dauphine – PSL • Paris, France	<i>2025 – Present</i>
PhD Student, Management; Governance & Regulation Chair University Paris-Dauphine – PSL (DRM) • Paris, France	<i>2022 – Present</i>

Education

PhD in Management University Paris-Dauphine – PSL • Paris, France	<i>2022 – Present</i>
Master 2 in Public Policy Paris 1 Panthéon-Sorbonne • Paris, France	<i>2021 – 2022</i>
Master 1 in Economics Toulouse School of Economics • Toulouse, France	<i>2020 – 2021</i>
Bachelor in Economics University of Lorraine • Nancy, France	<i>2017 – 2020</i>
Bachelor in Public Law University of Lorraine • Nancy, France	<i>2017 – 2020</i>

Publications

The Economics of Data-Sharing: An Empirical Investigation of Data Sharing Ecosystems 
with Eric Brousseau & Joëlle Toledano
ICIS 2025 Proceedings (2025)

ABSTRACT

This paper examines which economic and governance conditions make data-sharing ecosystems sustainable beyond pilot projects and public subsidies. Based on a qualitative study of 24 interviews with 20 orchestrators, participants, and experts across European sectors, complemented by practitioner workshops and conference feedback, it identifies six conditions: upfront and recurrent investment, use-case-based innovation, integration complexity, security risk, competitive risk, and incentive alignment. The contribution is to reframe data-sharing ecosystems as generative, use-case-oriented ecosystems rather than data marketplaces, and to show how strategic and technical orchestration must adapt across emergence, diffusion, and diversification phases.

Channel Composition: A Measurement Theory for Digital Trace Data
with Paul Favier

ABSTRACT

This paper develops a measurement theory explaining how production-channel composition reveals latent behavioral context beyond aggregate digital trace volume. Differences in channel affordances and frictions sort actors across devices, access modes, and interaction modalities. The framework specifies admissible channels, signal-volume and referent-alignment conditions, and a validate-then-deploy approach. An empirical demonstration links Wikipedia pageviews to hotel demand across 704 French destinations from 2018 to 2025, with replication against gate counts at six cultural attractions in Orléans. Channel composition identifies situated visitor activity beyond aggregate pageviews under the stated boundary conditions, advancing digital traces as theoretically grounded measurement instruments.

Making Data Exchangeable: Product Construction and the Redistribution of Coordination
Solo

ABSTRACT

This paper explains how data product construction redistributes coordination across artifacts, organizational relationships, and institutions. Temporal renewal, representational transparency, and composability embed recurring work in reusable products, while observation constraints, entitlements, and construction costs leave residual coordination elsewhere. Documentary cases elaborate the mechanism and its boundaries. An analysis of 4,525 marketplace listings from 407 providers finds associations between disclosed product profiles and disclosed exchange support, concentrated in delivery support after adjustment. Component results are uneven: update-frequency disclosures remain associated, composability becomes insignificant after adjustment, and method-independence scores are null. Listings do not measure coordination or completed transactions. Standardization redistributes coordination rather than eliminating it.

Models of Personal Data Regulation

with Rami Benabdelkrim & Surjasama Lahiri

ABSTRACT

This paper studies how countries converge toward European, Chinese, or American models of personal data regulation, and which political and economic factors shape that convergence. It builds a comparative dataset coding 70 legal provisions across 35 jurisdictions from 2013 to 2024, organized into ten dimensions of data protection. The method combines PCA-based clustering with panel fixed-effects regressions using lagged GDP, digitally delivered service exports, democratic status, and data-protection authority independence. The contribution is to provide empirical evidence for distinct regulatory blocs and to nuance the Brussels effect by showing how trade relations and institutional design help explain GDPR-style adoption.

Emergence of Data Sharing Ecosystems in Disaster Management

with Anouk Adrot & Salomé Ritouret

ABSTRACT

This paper investigates how formal norms for data sharing interact with bottom-up practices in disaster risk reduction ecosystems. Drawing on the Red Roses project, it combines grounded-theory coding of 37 semi-structured interviews with NLP-assisted mapping of actors, information actions, and data types, plus observations of a cross-border crisis simulation and secondary archival material. The contribution is to move debates on disaster data sharing beyond technical interoperability by showing how practitioners co-construct local standards, bridge divergent rules, and improvise when formal frameworks lack guidance, producing a practice-based account of the tension between top-down regulation and emergent coordination.

Conference Presentations

AIM – Association Information et Management	May 2026	Neuchâtel, Switzerland
ARCEP – Internal Academic Seminar	Feb 2026	Paris, France
ICIS (International Conference on Information Systems)	Dec 2025	Nashville, USA
KU Leuven – CiTiP Research Seminar	Nov 2025	Leuven, Belgium
AFREN (Association Française d'Économie du Numérique)	Jul 2025	Paris, France
EGOS (European Group for Organizational Studies)	Jul 2025	Athens, Greece
IOEA 22nd Session	May 2025	Cargèse, France
CCP - 3rd UK Workshop on Digital Economics	Nov 2024	London, UK
LINC Seminar (CNIL)	Jun 2024	Paris, France
IOEA 21st Session	May 2024	Cargèse, France
IOEA 20th Session	May 2023	Cargèse, France

Policy & Industry Engagement

Gaia-X Summit	Nov 2025	Porto, Portugal
Data-Sharing Ecosystems: Challenges and Turning Points	Sep 2025	Paris, France
Gaia-X Hub France Plenary Session	Mar 2025	Paris, France
